Solar Power System Details

Sunday, July 1, 2018

Installed 5/22/2017:

Solar Panel, Renogy, 100 W, 12V, MonoXstal

Solar Charge Controller, Renogy 40A Commander MPPT

Tracer Meter MT-50 for Commander controller

Battery, Deep Cycle, AGM, 12V, 100AH

40A ANL fuse set and

20A ANL Fuse set

Cable kit, 20 inch, 10-AWG, for charge controller to battery

2pc 1/0 AWG Cables Battery to Inverter 3 ft, 5/16 lugs

Controller has two green LEDs and 1 Red button:

Left LED = PV indicator (flashing is charging, solid is low voltage, Off is not charging, orange or red is a problem)

Right LED = Battery indicator (flashing is charging, solid is fully charged, orange or red is a problem)

Red Button is a combination indicator & switch for the Load or Power OUT. Illuminated is Power ON, dark is Power OFF. Pressing this button (or the OK button on monitor) will toggle this switch.

Tracer Meter

| Button | Function |
|--------|---------------------------|
| Esc | Access Main menu |
| Left | previous secondary screen |
| Up | previous info screen |
| Down | next info screen |
| Right | next secondary screen |
| OK | Choose an option |

Day = kWh since midnight Month = kWh for the current month Total = kWh since battery was last powered off

### Power Requirements

#### LED Dome Lights

320 mA / Light x 2 lights/dome x 2 domes = 1.28 A Duty cyle = 4 hours / night 1.28 A x 4 h = 5.12 Ah/day 5.12 Ah x 12 V = <u>61 Wh/day</u>

#### USB Charging for iPhone & iPad

iPhone: 1560 mAh Max Charging rate = 0.4A 0.4A @ 12V x 3.9h = 1560 mAh 1560 mAh x 12V = **19 Wh/charge** 

iPad: 7340 mAh Max charging rate = 1.5A 1.5A @ 12V x 4.9h 7340 mAh x 12V = **88 Wh/charge** 

#### <u>CPAP</u>

0.2A min when off but plugged in 2.0A max when on without humidifier

10 hr x 2 A = 20 Ah/night x 12 V = <u>240</u> Wh/day

#### **Refrigerator/Freezer**

Kenmore model 60412, 18 cu ft, rated: 404 kWh/yr = 1100 Wh/day 120VAC 6.0 A 22% duty cycle 0 W min - 140 W max

-----

Avg 18.5 kWh/month / 30 days = avg <u>617 Wh/day</u> 617 Wh / 24 h = avg 26 W 26 W / 22% = avg 118 W when on

| Fixed Tilt   | use the latitude, times 0.76, plus 3.1 degrees.                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Twice Yearly | best tilt angle for summer is the latitude, times 0.93, minus 21 degrees best tilt angle for winter is the latitude, times 0.875, plus 19.2 degrees. |

Seasonal adjustment:

For summer, take the latitude, multiply by 0.92, and subtract 24.3 degrees.

For spring and autumn, take the latitude, multiply by 0.98, and subtract 2.3 degrees.

For winter, take the latitude, multiply by 0.89, and add 24 degrees.

The graph below shows the effect of adjusting the tilt. The turquoise line shows the amount of solar energy you would get each day if the panel is fixed at the full year angle. The red line shows how much you would get by adjusting the tilt four times a year as described below. For comparison, the green line shows the energy you would get from two-axis tracking, which always points the panel directly at the sun. (The violet line is the solar energy per day if the panel is fixed at the winter angle, discussed below.) These figures are calculated for 40° latitude.

A zero tilt angle means that the face of the panel is aimed directly overhead. A positive tilt angle means that the panel faces more towards the equator. In the northern hemisphere that would mean tilting so it faces towards the South. Rarely, the tilt angle can be negative; this means the panel faces away from the equator.

The recommended angles can seem counterintuitive. For example, consider summer at 40° latitude. At noon on the solstice, the sun is 40° - 23.5° which is

16.5° from directly overhead. To capture the most sun at that time you would tilt the panel 16.5° to point it directly at the sun. On other days of the summer it is a bit lower in the sky, so you would want to tilt the panel a bit more. Yet we say to tilt it only 12.5°. The sun is ne ver that high. How can that be right?

The answer is that we are considering the whole day, not just noon. In the morning and evening, the sun moves lower in the sky and also further north (if you are in the northern hemisphere). It is necessary to tilt less to the south (or more to the north) to collect that sunligh t.
